PMD - DiMoGraph Motivation

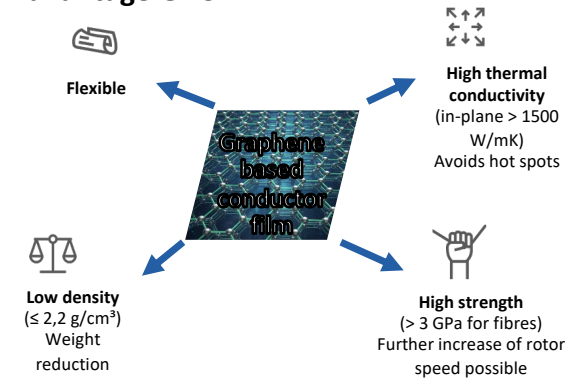

Copper demand

- Copper (Cu) demand will double to 53 million tons/year by 2050
 - Current mined Cu production capacity only projected to increase by 20% over the next decade
 - Oxygen-free Cu is used in electrical applications
 - +57% increase in demand till 2035
 - Strong increase by transport electrification
- In long-term Cu price could double or even triple
→ Graphene-based conductors (GBC) as potential Cu replacement

Advantage GBC

Comparison to copper

- Abundancy of carbon is 10x higher
- Carbon deposits are all over the world
→ High security of supply
- Less energy needed for raw material extraction
- Electrical conductivity can reach up to 50% of copper by intercalation of strong Lewis acids.

Future copper demand will surpass mining capacities!

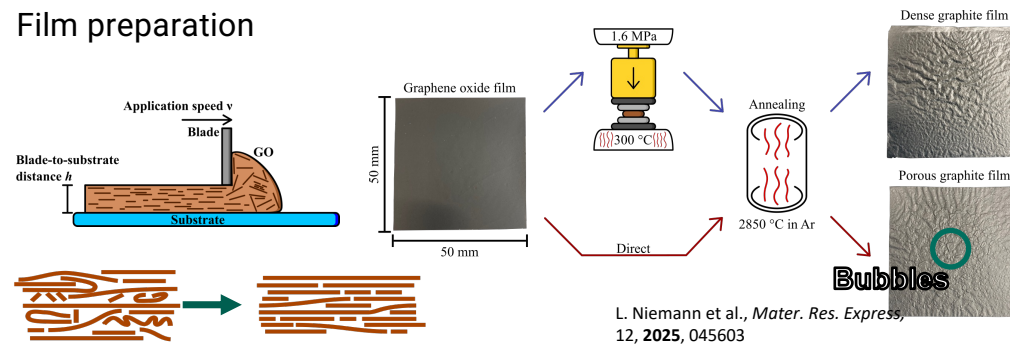

PMD - DiMoGraph

Experimental progress

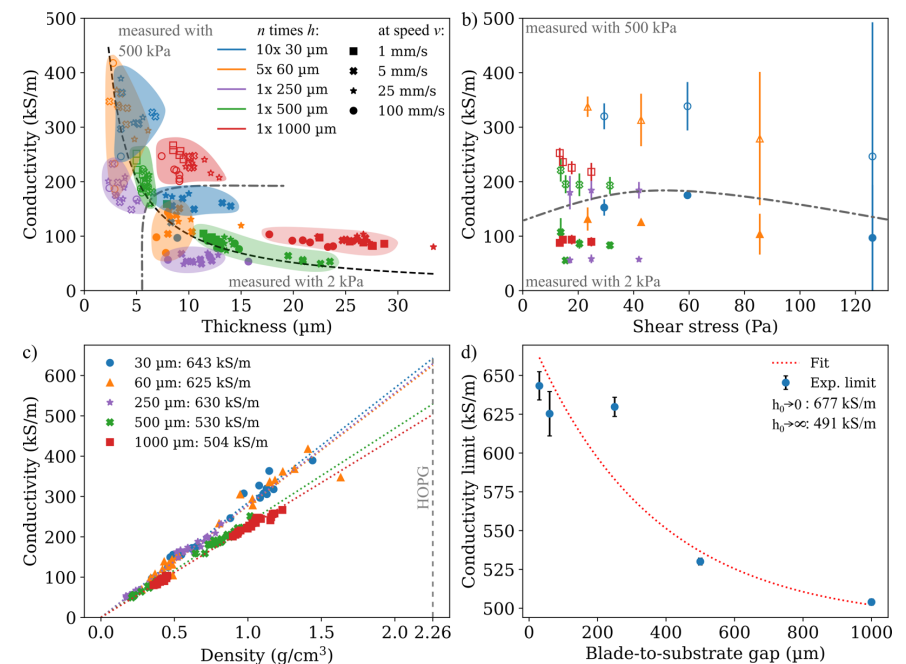

Improve graphite flake networks by blade-coating

Film preparation

- Final electrical conductivity after doping depends on conductivity of starting material
- Electrical conductivity usually independent of object dimensions
→ Here: Dependency on the thickness
- Shear stress does not influence conductivity
- Blade-to-substrate gap seems crucial for high electrical conductivity

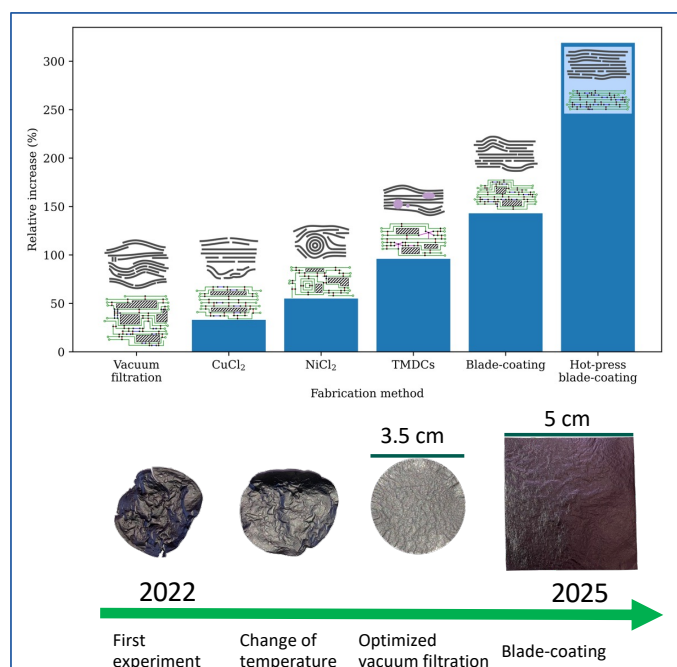

Small blade-to-substrate gap forces mechanically flakes to align parallel to each other.

PMD - DiMoGraph

Experimental progress

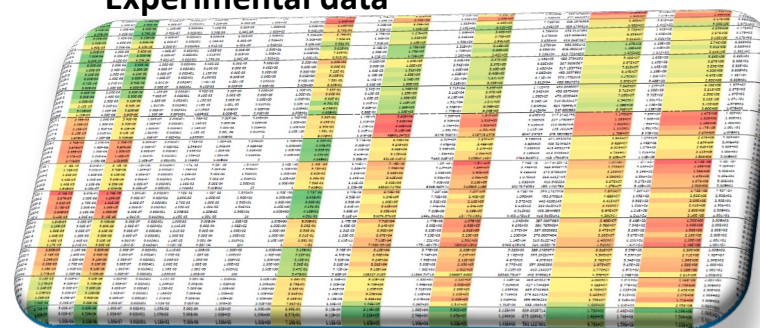

Impact of processing on electr. conductivity

- Ordering of flakes
 - Reduced porosity
 - Improvement of conductivity
- Hot-press densification with strong impact on conductivity
- Blade-coating needs no additives

Experimental data

Improvement of graphene oxide flake based graphite conductors by progress in flake orientation

PMD - DiMoGraph Summary

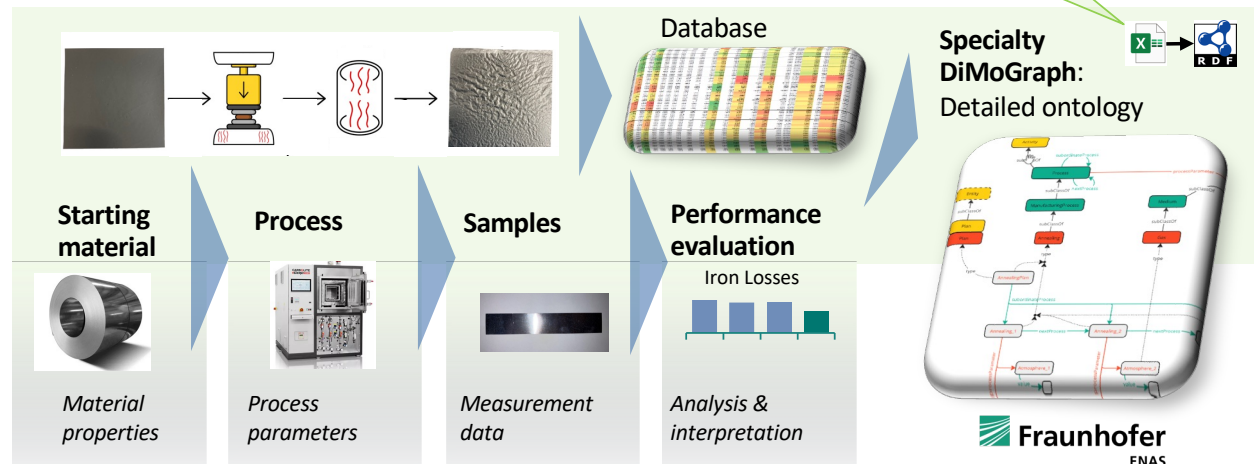

Results

- Detailed ontology for fabrication of graphene oxide based graphite films
- Integrate simulations and their refinement via machine learning
- Insight into possibilities of Digital material research:
 - Speed up data analysis
 - Make historical data usable
- Ongoing application:
 - Soft magnets: Magnetic properties analysis

Graphene
Conductor

Soft Magnets

Conclusions

- Ontology enables deep understanding of all process steps and their holistic interactions
- Manual creation of an ontology is possible, but inefficient.
- Large benefit (understanding, structuring, speed, IP generation ...) is expected for complex datasets.

DiMoGraph paved the way into Digital Materials Research

Thank You 😊
